

1- Cucumber
Dependencies :

```
<dependency>
  <groupId>io.cucumber</groupId>
  <artifactId>cucumber-testng</artifactId>
  <version>7.18.0</version>
  <scope>test</scope>
</dependency>
```

```
<dependency>
  <groupId>io.cucumber</groupId>
  <artifactId>cucumber-java</artifactId>
  <version>7.20.1</version>
</dependency>
```

1 – feature file :
Mahe the dir of feature file :

Then define the feature file :

```
Feature: user can login to the system
Scenario: user login with valid credentials
  Given user enter valid user name and password
  When user click to login button
  Then a success message will be appeared
```

2- Define the page :

```

public class LoginPage {
    private static WebDriver driver;

    public LoginPage (WebDriver driver){
        this.driver = driver;
    }

    By usernameField = By.id("username");
    By passwordField = By.id("password");
    By submitBtn = By.id("submit");

    By successMSG = By.xpath("//h1[text()='Logged In Successfully']");

    public void setUsername(String username){
        driver.findElement(usernameField).sendKeys(username);
    }

    public void setPassword (String password) {
        driver.findElement(passwordField).sendKeys(password);
    }

    public void clickSubmit () {
        driver.findElement(submitBtn).click();
    }

    public String getMSG() {
        return driver.findElement(successMSG).getText();
    }

    public String getURL(){
        return driver.getCurrentUrl();
    }
}

```

3- Then define the hooks

```

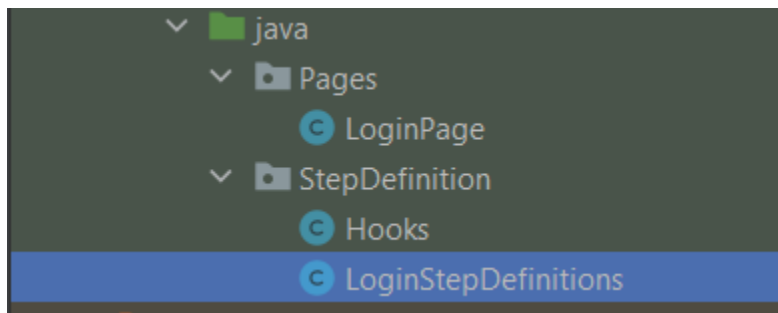

public class Hooks {
    public static WebDriver driver;

    @Before
    public void setUp() {
        System.setProperty("webdriver.http.factory", "jdk-http-client");
        WebDriverManager.chromedriver().setup();
        driver = new ChromeDriver();
        driver.manage().window().maximize();
        driver.manage().timeouts().implicitlyWait(30, TimeUnit.SECONDS);
        driver.get("https://practicetestautomation.com/practice-test-
login/");
        System.out.println("d"+driver);
    }

    @After
    public void teardown()
    {
        driver.quit();
    }
}

```

4- Define the step definition :

```

public class LoginStepDefinitions extends Hooks{
    Pages.LoginPage login ;

    @Before
    public void initLoginPage() {

        login = new LoginPage(driver); // Initialize after driver setup
    }
}

```

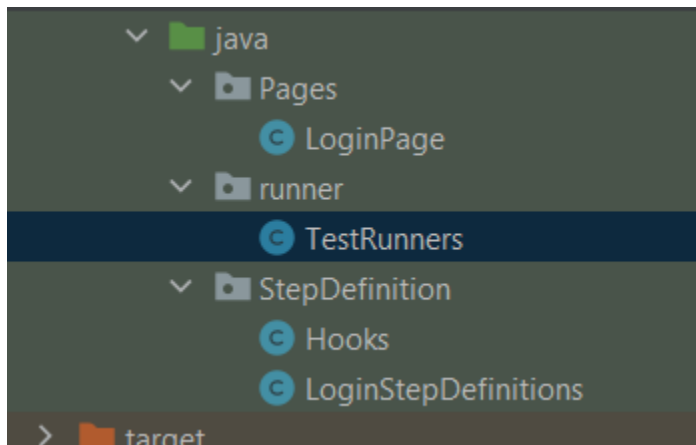

```

}

@Given("user enter valid user name and password")
public void enterUserAndPassword(){
    //new Pages.LoginPage(Hooks.driver);
    //System.out.println("j"+Hooks.driver);
    login.setUserName("student");
    login.setPassword("Password123");
}
@When("user click to login button")
public void clickOnLoginBtn(){
    login.clickSubmit();
}
@Then("a success message will be appeared")
public void successMsg(){
    Assert.assertEquals(login.getMSG(), "Logged In Successfully");
}
}

```

5- Define the runner :

```

public class TestRunners {

    @CucumberOptions(
        features = "src\\main\\resources\\Feature",
        glue = {"StepDefinition"},
        plugin = {"pretty", "html:target/cucumber"},
        tags = "@E2E"
    )

    public static class testRunners extends AbstractTestNGCucumberTests {
    }

}

```
